

## How to Move a Package to the Repository

The steps below will assist you in copying a package you have created into a repository for safekeeping. The package is copied and moved to the repository instead of taking the originally created package. Using this process allows you to monitor packages on a workstation and then move PC Network Deploy to a server for full deployment under all needed privileges to the remote computers.

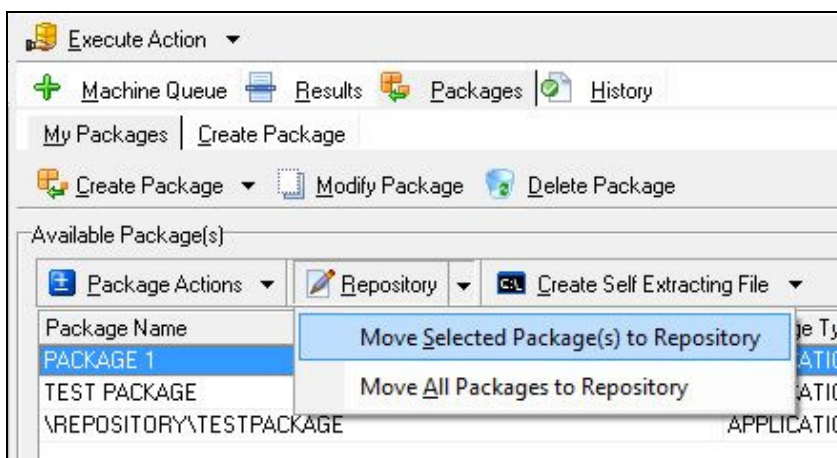

**Important: Make sure that all files and folders are installed locally for this package before continuing.**

1. Select the **My Packages** tab.

2. Highlight the package(s) you want to move. (Note: If you wish to move more than one package at a time, press the CTRL button and click on the appropriate packages.)

3. Choose **Repository > Move Selected Package(s) to Repository**.

4. Click **Yes** if you are ready to move the selected packages.
