

How to Run Process using WMI on Network Computers

The File Process Management feature allows you to enter the name of up to three processes on the networked machines that you want to execute. This feature can also be run using another's login if you need to run processes using credentials with administrator privileges.

1. Select **Execute Action > File Process Management > Run Process via WMI**.

2. Enter a name for the process you want to run.
3. If you would like to run more than one process, place a checkmark in the *I want to run more...* box(es) and type the additional commands.
4. Place a checkmark in the box labeled *Use Credentials* if you want to login with a specific users information.
5. Enter a Username and Password if applicable.

6. Click **Ok** when finished.
